Simple CRUD Application

SmartShop (Django Rest Framework + React JS)

A functional Full-Stack CRUD (Create, Read, Update, Delete) application .

Project Overview

```

```

Step 1: Backend Implementation (Django REST Framework)

The backend provides the API infrastructure to handle data persistence.

1. **Model Definition**: Created a Product model in products/models.py with fields for name, description, price , stock, and image_url.

2. **Serialization**: Used serializers.ModelSerializer to automatically convert Django model instances into JSON format.
3. **API Views**: Implemented viewsets.ModelViewSet, which provides the following logic out-of-the-box:

   GET /api/products/ (List all products)

   POST /api/products/ (Create a new product)

   GET /api/products/{id}/ (Retrieve a single product)

   PUT /api/products/{id}/ (Update a product)

   DELETE /api/products/{id}/ (Remove a product)

Step 2: Frontend Implementation (React JS)

The frontend consumes the API and provides an interactive user interface.

API Service Layer: Created src/api/products.js using the Native Fetch API to centralize all network requests to the Django backend.

State Management:

- **Local State**: Used useState and useEffect hooks in components to fetch and store product data.
- **Global State**: Implemented React Context API (CartContext) to manage a persistent shopping cart across different views.

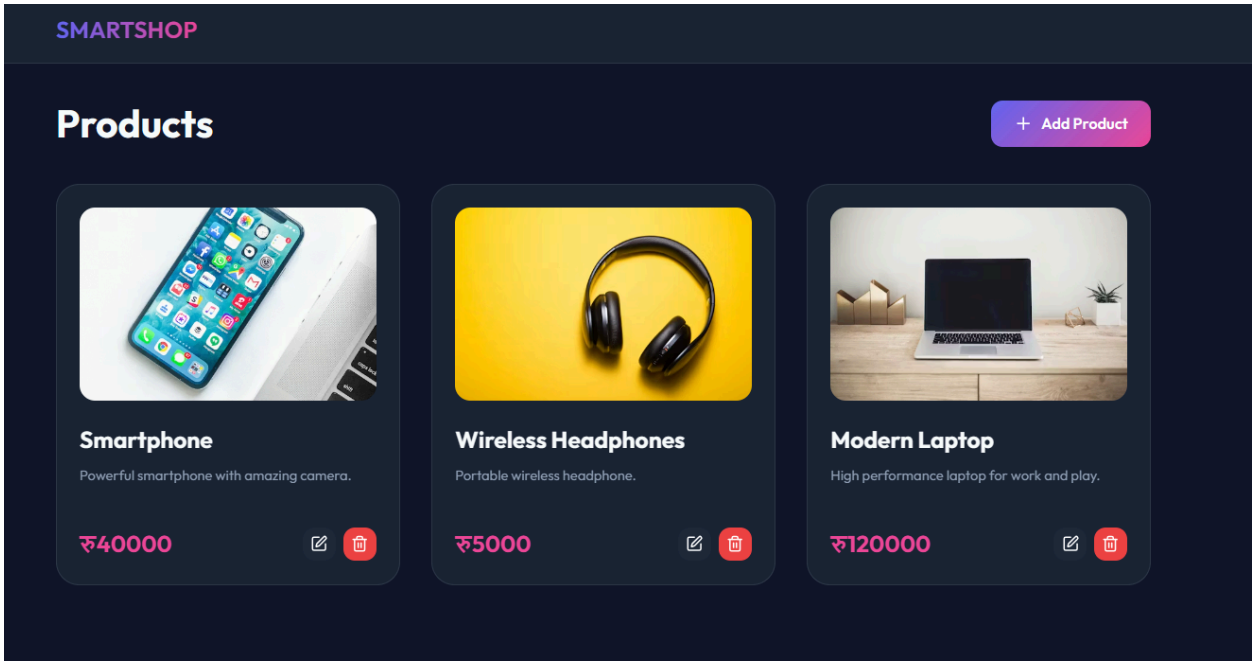
Routing: Utilized react-router to handle navigation between the **Product List (Home)** and the **Product Form (Add/Edit)** pages.

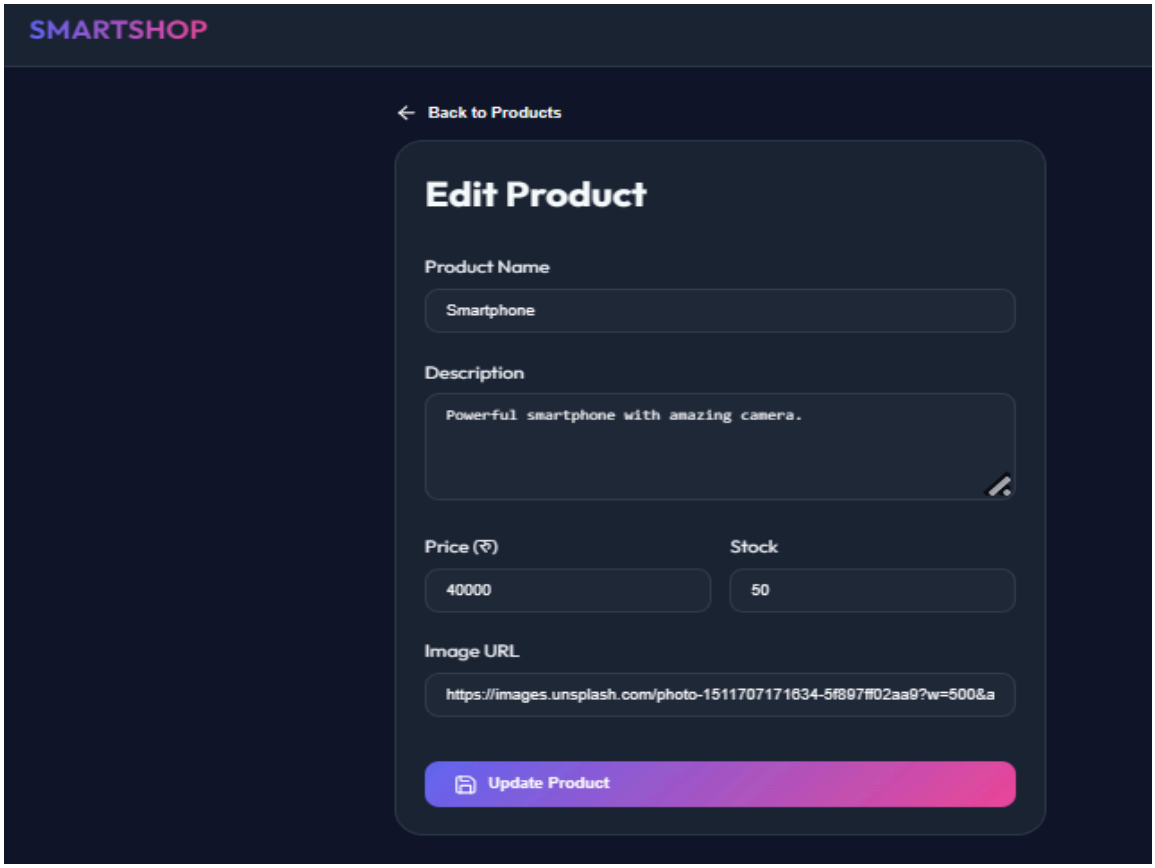
UI Components:

HomePage: Handles **Read** (listing products) and **Delete** actions.

ProductFormPage: Handles both **Create** and **Update** actions using a dynamic form

Output:





SMARTSHOP
